

Pipelines and fittings for the outdoor sewerage

Outdoor sewerage

Outdoor sewerage represents the pipeline network, used for drain disposal from living accommodation and industrial sectors to treatment facilities or waste water storage. The main elements of the sewerage system, both outdoor and sanitary, are the sewage pipes. Among the sewage pipes the most popular are the articles made from polymeric materials, among which the polyvinyl chloride pipes and polypropylene pipes.

Sewage pipes are selected, on the basis of the required characteristics of the concrete pipeline. Articles made from the polymeric materials, including the sewage pipes, have got a number of advantages: overstability at low-density of the material, chemical resistance, resistant to internal wear, ecological safety and durability. Of not little interest of the plastic pipes for outdoor sewerage is their not-too-high price, especially if we compare with their metal analogues.

Operational data for the sewage pipes:

temperature ceiling – 60°C;

resistance to temperature difference – 0–45°C;

PIPE SN4
